1. Executive Summary & Abstract

Bitcoin Lite Edition (BLTE) is an independent cryptographic digital asset engineered natively on the Solana blockchain. Built upon the foundational paradigm of digital scarcity established by Bitcoin in 2008, Bitcoin Lite Edition couples an ultra-scarce, mathematically sealed supply with high-throughput, sub-second execution.

IMPORTANT LEGAL & CONCEPTUAL DISTINCTION: Bitcoin Lite Edition is not Bitcoin, is not an official Bitcoin product, and is not affiliated with, endorsed by, or issued by Bitcoin Core, Satoshi Nakamoto, or any Bitcoin developer organizations. It operates exclusively on Solana as an SPL / Token-2022 asset with independent governance and zero counterparty exposure.

2. Foundational Philosophy: Digital Scarcity

While Bitcoin demonstrated that mathematical scarcity can anchor decentralized digital value, Proof-of-Work architectures face structural friction: multi-minute confirmation latency, unpredictable mempool fee spikes, and intense thermodynamic energy consumption. Bitcoin Lite Edition adopts absolute mathematical scarcity—enforcing a fixed cap of 2,100,000 tokens (2.1M, exactly 10x numerically scarcer than Bitcoin's 21,000,000 limit)—while operating on Solana's eco-friendly Proof-of-History (PoH) consensus.

Scarcity in Bitcoin Lite Edition is strictly non-inflationary: there are zero secondary mints, dynamic emission schedules, or validator staking rewards paid through newly created tokens. Every unit of BLTE was created at block zero and cannot be inflated.

3. The Genesis Paradigm

Conceived as a pure realization of digital scarcity on modern rails, BLTE was issued with 2,100,000 total tokens. At genesis, both the Mint Authority and Freeze Authority were irrevocably revoked (set to null), permanently eliminating team discretion.

The "Lite" designation represents sub-second ~400ms finality, sub-penny settlement fees (<$0.001 per transfer), and effortless friction-free transactions.

4. Technical Distinction from Bitcoin

Bitcoin operates on its own dedicated Layer 1 network utilizing Proof-of-Work (PoW) mining, SHA-256 hashing, UTXO accounting, and 10-minute block intervals with a 21,000,000 coin cap.

Bitcoin Lite Edition operates natively on Solana Layer 1 utilizing Proof-of-History (PoH) and Tower BFT consensus, account-based state transitions, ~400 millisecond blocks, and a fixed cap of 2,100,000 BLTE. It is completely independent in code, consensus, and state.

FEATURE	BITCOIN (BTC)	BITCOIN LITE EDITION (BLTE)
Consensus Mechanism	Proof-of-Work (SHA-256)	**Proof-of-History / PoS**
Block Finality	10–60 Minutes (6 confirms)	**~400 Milliseconds (instant)**
Transaction Fee	Variable ($1.50 – $35.00+)	**< $0.001 (sub-penny)**
Maximum Supply	21,000,000 BTC	**2,100,000 BLTE (10x Scarcer)**

5. Solana Execution Layer & Consensus

Solana utilizes Proof-of-History (PoH) as a cryptographic clock before consensus. Combined with Tower BFT, this allows the network to order transactions without waiting for global block broadcast consensus before sequencing.

This architecture ensures that Bitcoin Lite Edition transactions settle in sub-second intervals with negligible network fees, making micro-transfers and DeFi integrations frictionless without reliance on secondary custodial channels or bridging protocols.

6. Protocol & Token Parameters

The core parameters of Bitcoin Lite Edition are permanently encoded in the Solana SPL Token-2022 configuration without upgrade proxies or mutability hooks:

TOKEN NAME
Bitcoin Lite Edition

TICKER / SYMBOL
BLTE

NETWORK EXECUTION
Solana Layer 1 Mainnet

PROGRAM STANDARD
SPL / Token-2022

TOTAL SUPPLY CAP
2,100,000 BLTE (Strict Cap)

TOKEN RESOLUTION
9 Decimals (0.000000001 BLTE)

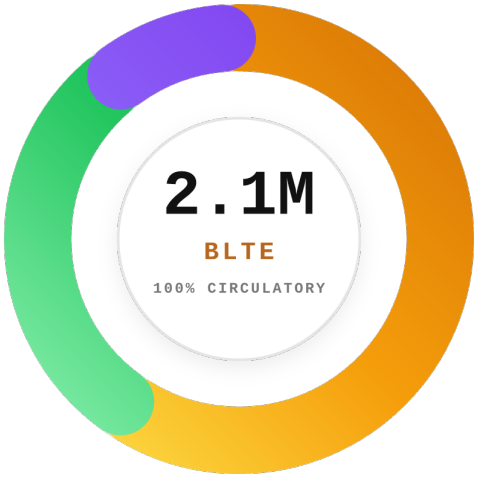

MINT AUTHORITY
Permanently Revoked (Null)

FREEZE AUTHORITY
Permanently Revoked (Disabled)

7. Tokenomics & Mathematical Allocation

Bitcoin Lite Edition is engineered with absolute mathematical scarcity, strictly capped at 2,100,000 BLTE (2.1M) at genesis. In adherence to zero-premine principles, 100% of the total supply is fully accounted for on-chain with permanently revoked mint authority, zero unminted reserves, and zero dilution.

TOTAL SUPPLY	CIRCULATION	MINT & FREEZE
2,100,000 BLTE	**100% Unlocked**	**Revoked (Null)**
Strict Inviolable Cap	Zero Unminted Reserve	Zero Dilution / Tamper-Proof

SOLANA MAINNET L1 · INVIOLABLE GENESIS DISTRIBUTION

FAIR LAUNCH

60% **1,260,000 BLTE**

Direct community fair launch distribution on Solana with borderless access.

1,260,000 BLTE · 100% Unlocked

LIQUIDITY

30% **630,000 BLTE**

Automated market maker DEX pool deployment on Raydium with locked LP.

630,000 BLTE · Raydium AMM

STAKING & DEV

10% **210,000 BLTE**

On-chain staking reward incentives (11.61% APY) & core developer fund.

210,000 BLTE · 11.61% Escrow

ALLOCATION CATEGORY	SHARE %	BLTE AMOUNT	VESTING / UNLOCK	ON-CHAIN STATUS
Fair Launch Distribution	60.0%	**1,260,000 BLTE**	100% Genesis Unlocked	Public Solana Access
Liquidity Pool (Raydium)	30.0%	**630,000 BLTE**	100% Genesis Unlocked	AMM DEX Initialized
Staking Rewards & Developer	10.0%	**210,000 BLTE**	100% Genesis Unlocked	Streamflow Escrow APY
Total Inviolable Cap	100.0%	**2,100,000 BLTE**	100% Circulatory	Mathematically Sealed

MATHEMATICAL INTEGRITY & ZERO-TRUST GENESIS VERIFICATION

- Total Cap: 2,100,000 BLTE strictly fixed at block zero (100% accounted for on-chain).
- Mint Authority: Permanently revoked (set to null address; impossible to mint additional tokens).
- Freeze Authority: Permanently disabled (no centralized blacklists or account freezes).
- Dilution Exposure: 0.00% (zero secondary inflation, zero unlocks, zero developer vesting overhang).

8. Immutability & Revoked Authorities

To guarantee decentralized custody and eliminate counterparty risk, the SPL mint authority was permanently set to null immediately upon token creation on Solana genesis. Freeze authority was disabled simultaneously.

No developer, smart contract upgrade proxy, or multi-signature treasury wallet can ever mint additional tokens or freeze user accounts. The token supply of 2,100,000 BLTE is mathematically sealed forever.

9. Strategic Development Roadmap

Phase 01: Foundation — COMPLETED

Architecture design, White Paper publication, transparency portal, Devnet verification.

Phase 02: Launch — IN PROGRESS

Mainnet token deployment, authority revocation verification, initial DEX liquidity initialization.

Phase 03: Ecosystem — UPCOMING

Real-time on-chain supply and holder analytics, decentralized governance tooling, Solana DeFi integrations.

Phase 04: Expansion — UPCOMING

Long-term digital scarcity preservation, cross-program tooling, and open developer documentation.

10. Zero-Trust On-Chain Verification

All token parameters, supply figures, holder distributions, and authority configurations can be verified independently by any party using public Solana block explorers (such as Solscan and Solana Explorer).

The codebase and token standards rely exclusively on open-source Solana standard libraries, guaranteeing auditability and transparent cryptographic verification.

LEGAL DISCLAIMER & NON-AFFILIATION DISCLOSURE

Bitcoin Lite Edition is an independent Solana cryptographic token and is NOT affiliated with, endorsed by, or a fork of Bitcoin Core, Satoshi Nakamoto, or any Bitcoin developer organizations. This white paper is published for informational and architectural description purposes only and does not constitute financial, investment, or legal advice. Digital assets involve substantial market risk and volatility. Always verify on-chain contracts independently on Solscan.
