CHAPTER 1

1. Executive Summary & Abstract

Bitcoin Lite Edition (BLTE) is an independent cryptographic digital asset built natively on the Solana blockchain. Inspired by the foundational paradigm of digital scarcity established by Bitcoin in 2008, Bitcoin Lite Edition explores the application of an ultra-scarce, mathematically capped asset within a modern, high-throughput, low-latency execution environment.

IMPORTANT LEGAL & CONCEPTUAL DISTINCTION: Bitcoin Lite Edition is not Bitcoin, is not an official Bitcoin product, and is not affiliated with, endorsed by, or issued by Bitcoin Core, Satoshi Nakamoto, or any Bitcoin developer organizations. It operates exclusively on Solana as an SPL / Token-2022 digital asset.

CHAPTER 2

2. Foundational Philosophy: Digital Scarcity

While Bitcoin proved that mathematical scarcity can form the basis of decentralized digital store-of-value, proof-of-work architectures face structural limitations including multi-minute block latency, volatile mempool fee spikes, and intensive thermodynamic energy consumption. Bitcoin Lite Edition adopts the principle of absolute digital scarcity—enforcing a fixed cap of 2,100,000 tokens (2.1M) with permanently revoked mint authority—while leveraging Solana's Proof-of-History (PoH) consensus for sub-second block finality.

Scarcity in Bitcoin Lite Edition is strict and non-inflationary: there are no secondary mints, dynamic emission curves, or validator staking rewards paid through unbacked token issuance.

CHAPTER 3

3. The Genesis of Bitcoin Lite Edition

Conceived as a modern realization of digital scarcity, BLTE was created with exactly 2,100,000 tokens (2.1M, 10x numerically scarcer than Bitcoin's 21,000,000 limit). At block zero, both Mint Authority and Freeze Authority were irrevocably revoked (set to null).

The "Lite" paradigm represents sub-second ~400ms finality, sub-penny settlement fees (<$0.001 per transfer), and eco-friendly Proof-of-Stake consensus.

CHAPTER 4

4. Technical Distinction from Bitcoin

Bitcoin operates on its own dedicated Layer 1 network utilizing Proof-of-Work (PoW) mining, SHA-256 hashing, UTXO transaction accounting, and 10-minute block intervals with a 21,000,000 coin cap.

Bitcoin Lite Edition is an SPL token on the Solana Layer 1, utilizing Proof-of-History (PoH) and Tower BFT consensus, account-based state transitions, ~400 millisecond blocks, and a fixed cap of 2,100,000 BLTE (2.1M). It is completely independent in governance, codebase, consensus, and ledger infrastructure.

CHAPTER 5

5. Solana Execution Layer & Consensus

Solana utilizes Proof-of-History (PoH) as a cryptographically verifiable clock before consensus. Combined with Tower BFT, this allows the network to process transactions without waiting for global block broadcast consensus before sequencing.

This architecture ensures that Bitcoin Lite Edition transactions confirm within ~400ms with negligible fees (<$0.001), making micro-transfers and interactive DeFi integrations feasible without reliance on secondary routing layers.

CHAPTER 6

6. Technical Token Specifications

- Token Name: Bitcoin Lite Edition
- Token Symbol / Ticker: BLTE
- Network: Solana Layer 1 Blockchain
- Token Program Standard: SPL / Token-2022
- Total Supply: 2,100,000 BLTE (2.1M Strict Fixed Cap)
- Decimals: 9 (0.000000001 BLTE base unit resolution)
- Mint Authority: Permanently Revoked (Null address)
- Freeze Authority: Permanently Revoked (Null address)

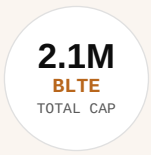
CHAPTER 7

7. Tokenomics & Mathematical Allocation

The total token supply is strictly configured at 2,100,000 tokens (2.1M), structured across two strategic allocations only:

- Fair Launch: 70% (1,470,000 BLTE) — Direct community and public fair launch distribution on Solana with borderless access.
- Liquidity Pool: 30% (630,000 BLTE) — Automated market maker (AMM) DEX liquidity pool deployment on Raydium.

CIRCULAR TOKENOMIC ARCHITECTURE · 100% INVIOLABLE GENESIS DISTRIBUTION



Fair Launch (1,470,000 BLTE)
Direct community and public fair launch distribution on Solana with borderless access.

Liquidity Pool (630,000 BLTE)
Automated market maker (AMM) DEX liquidity pool deployment on Raydium.

VERIFIED: 100% Mathematical Integrity · 2,100,000 / 2,100,000 BLTE Accounted For · Mint Authority Revoked

CHAPTER 8

8. Immutability & Revoked Authorities

To guarantee absolute decentralized custody and eliminate counterparty risk, the SPL mint authority was permanently set to null immediately upon genesis token creation. Freeze authority is disabled.

No team member, smart contract upgrade proxy, or multi-signature wallet can ever mint additional tokens or freeze user accounts.

CHAPTER 9

9. Strategic Development Roadmap

- Phase 01: Foundation — Architecture design, White Paper publication, transparency portal, Devnet verification (Completed).
- Phase 02: Launch — Mainnet token deployment, authority revocation verification, initial DEX liquidity initialization (In Progress).
- Phase 03: Ecosystem — Real-time on-chain supply and holder analytics, decentralized governance tooling, Solana DeFi integrations (Upcoming).
- Phase 04: Expansion — Long-term digital scarcity preservation, cross-program tooling, and open developer documentation (Upcoming).

CHAPTER 10

10. Zero-Trust On-Chain Verification

All token parameters, supply figures, holder distributions, and authority configurations can be verified independently by any party using public Solana block explorers (such as Solscan and Solana Explorer).

The code and token standards rely exclusively on open-source Solana standard libraries, guaranteeing auditability and transparent cryptographic verification.

LEGAL DISCLAIMER & NON-AFFILIATION DISCLOSURE

Bitcoin Lite Edition is an independent Solana cryptographic token and is NOT affiliated with, endorsed by, or a fork of Bitcoin Core, Satoshi Nakamoto, or any Bitcoin developer organizations. This white paper is published for informational and architectural description purposes only and does not constitute financial, investment, or legal advice. Digital assets involve substantial market risk and volatility. Always verify on-chain contracts independently on Solscan.
